

Species List

Underwater Surveyor uses a species list to help the user select the correct fish species from a pick list. This primarily ensures species naming is consistent and allow exported data from resulting surveys to be collated.

Assign Species

Species:

planifrons/Threespot damselfish

X

Q

Genus:

planifrons/Threespot damselfish

Family:

Pomacentridae/Damselfishes

Q

Number of Fish:

1

Comment

Stegastes - planifrons/Threespot damselfish

Source: Fishbase

The species list contains four items:

- **Family**
- **Genus**
- **Species**
- **Unique Species ID**

The preferred format is to present the **Family** and **Species** as Latin name/Common name and for the Unique Species ID to be the ID used by [FishBase](#) in the form: Fishbase:<ID>. Below is an example of a three line from a species list:

Holocentridae/Squirrelfishes	Sargocentron	bullisi/Deepwater squirrelfish	FishBase:3622
Kyphosidae/Chubs	Kyphosus	sectatrix/Bermuda chub	FishBase:2498
Labridae/Wrasses	Bodianus	parrae/Creole wrasse	FishBase:3656

The use of the FishBase ID as the ***Unique Species ID*** allow the application to automatically download the species images from FishBase to help the user with species identification.

Predefined Species Lists

Underwater Surveyor comes with predefined region specific lists.

[Add how to find and select those list]

New Species List

You can also create your own Species List.

[How to create a name a new list]

[How to populate the species list one by one through the ID]

[How to batch create a new species list using the command line utility]

Add to or Remove from Species List

[use to add/remove from a species list]
